

Glossary

Data Analytics

Terms and definitions from Course 3

A

Access control: Features such as password protection, user permissions, and encryption that are used to protect a spreadsheet

Administrative metadata: Metadata that indicates the technical source of a digital asset

Agenda: A list of scheduled appointments

Analytical thinking: The process of identifying and defining a problem, then solving it by using data in an organized, step-by-step manner

Audio file: Digitized audio storage usually in an MP3, AAC, or other compressed format

B

Bad data source: A data source that is not reliable, original, comprehensive, current, and cited (ROCCC)

Bias: A conscious or subconscious preference in favor of or against a person, group of people, or thing

Boolean data: A data type with only two possible values, usually true or false

C

Confirmation bias: The tendency to search for or interpret information in a way that confirms pre-existing beliefs

Consent: The aspect of data ethics that presumes an individual's right to know how and why their personal data will be used before agreeing to provide it

Continuous data: Data that is measured and can have almost any numeric value

Cookie: A small file stored on a computer that contains information about its users

CSV (comma-separated values) file: A delimited text file that uses a comma to separate values

Currency: The aspect of data ethics that presumes individuals should be aware of financial transactions resulting from the use of their personal data and the scale of those transactions

D

Data anonymization: The process of protecting people's private or sensitive data by eliminating identifying information

Data bias: When a preference in favor of or against a person, group of people, or thing systematically skews data analysis results in a certain direction

Data element: A piece of information in a dataset

Data ethics: Well-founded standards of right and wrong that dictate how data is collected, shared, and used

Data governance: A process for ensuring the formal management of a company's data assets

Data interoperability: The ability to integrate data from multiple sources and a key factor leading to the successful use of open data among companies and governments

Data model: A tool for organizing data elements and how they relate to one another

Data privacy: Preserving a data subject's information any time a data transaction occurs

Data security: Protecting data from unauthorized access or corruption by adopting safety measures

Data type: An attribute that describes a piece of data based on its values, its programming language, or the operations it can perform

Data visualization: The graphical representation of data

Descriptive metadata: Metadata that describes a piece of data and can be used to identify it at a later point in time

Digital photo: An electronic or computer-based image usually in BMP or JPG format

Discrete data: Data that is counted and has a limited number of values

E

Ethics: Well-founded standards of right and wrong that prescribe what humans ought to do, usually in terms of rights, obligations, benefits to society, fairness, or specific virtues

Experimenter bias: The tendency for different people to observe things differently (also called observer bias)

External data: Data that lives, and is generated, outside of an organization

F

Fairness: A quality of data analysis that does not create or reinforce bias

Field: A single piece of information from a row or column of a spreadsheet; in a data table, typically a column in the table

First-party data: Data collected by an individual or group using their own resources

Foreign key: A field within a database table that is a primary key in another table (Refer to primary key)

FROM: The section of a query that indicates where the selected data comes from

G

General Data Protection Regulation of the European Union (GDPR): Policy-making body in the European Union created to help protect people and their data

Geolocation: The geographical location of a person or device by means of digital information

Good data source: A data source that is reliable, original, comprehensive, current, and cited (ROCCC)

H

I

Internal data: Data that lives within a company's own systems

Interpretation bias: The tendency to interpret ambiguous situations in a positive or negative way

J

K

L

Long data: A dataset in which each row is one time point per subject, so each subject has data in multiple rows

M

Mentor: Someone who shares knowledge, skills, and experience to help another grow both professionally and personally

Metadata: Data about data

Metadata repository: A database created to store metadata

N

Naming conventions: Consistent guidelines that describe the content, creation date, and version of a file in its name

Networking: Building relationships by meeting people both in person and online

Nominal data: A type of qualitative data that is categorized without a set order

Normalized database: A database in which only related data is stored in each table

Notebook: An interactive, editable programming environment for creating data reports and showcasing data skills

O

Observer bias: The tendency for different people to observe things differently (also called experimenter bias)

Open data: Data that is available to the public

Openness: The aspect of data ethics that promotes the free access, usage, and sharing of data

Ordinal data: Qualitative data with a set order or scale

Ownership: The aspect of data ethics that presumes individuals own the raw data they provide and have primary control over its usage, processing, and sharing

P

Pixel: In digital imaging, a small area of illumination on a display screen that, when combined with other adjacent areas, forms a digital image

Population: In data analytics, all possible data values in a dataset

Primary key: An identifier in a database that references a column in which each value is unique (Refer to foreign key)

Q

R

Record: A collection of related data in a data table, usually synonymous with row

Redundancy: When the same piece of data is stored in two or more places

Relational database: A database that contains a series of tables that can be connected to form relationships

S

Sample: In data analytics, a segment of a population that is representative of the entire population

Sampling bias: Overrepresenting or underrepresenting certain members of a population as a result of working with a sample that is not representative of the population as a whole

Schema: A way of describing how something, such as data, is organized

Second-party data: Data collected by a group directly from its audience and then sold

SELECT: The section of a query that indicates the subset of a dataset

Social media: Websites and applications through which users create and share content or participate in social networking

String data type: A sequence of characters and punctuation that contains textual information (Refer to Text data type)

Structural metadata: Metadata that indicates how a piece of data is organized and whether it is part of one or more than one data collection

Structured data: Data organized in a certain format such as rows and columns

T

Text data type: A sequence of characters and punctuation that contains textual information (also called string data type)

Third-party data: Data provided from outside sources who didn't collect it directly

Transaction transparency: The aspect of data ethics that presumes all data-processing activities and algorithms should be explainable and understood by the individual who provides the data

U

Unbiased sampling: When the sample of the population being measured is representative of the population as a whole

United States Census Bureau: An agency in the U.S. Department of Commerce that serves as the nation's leading provider of quality data about its people and economy

Unstructured data: Data that is not organized in any easily identifiable manner

V

Video file: A collection of images, audio files, and other data usually encoded in a compressed format such as MP4, MV4, MOV, AVI, or FLV

W

WHERE: The section of a query that specifies criteria that the requested data must meet

Wide data: A dataset in which every data subject has a single row with multiple columns to hold the values of various attributes of the subject

World Health Organization: An organization whose primary role is to direct and coordinate international health within the United Nations system
